

Project Report

TITLE PAGE

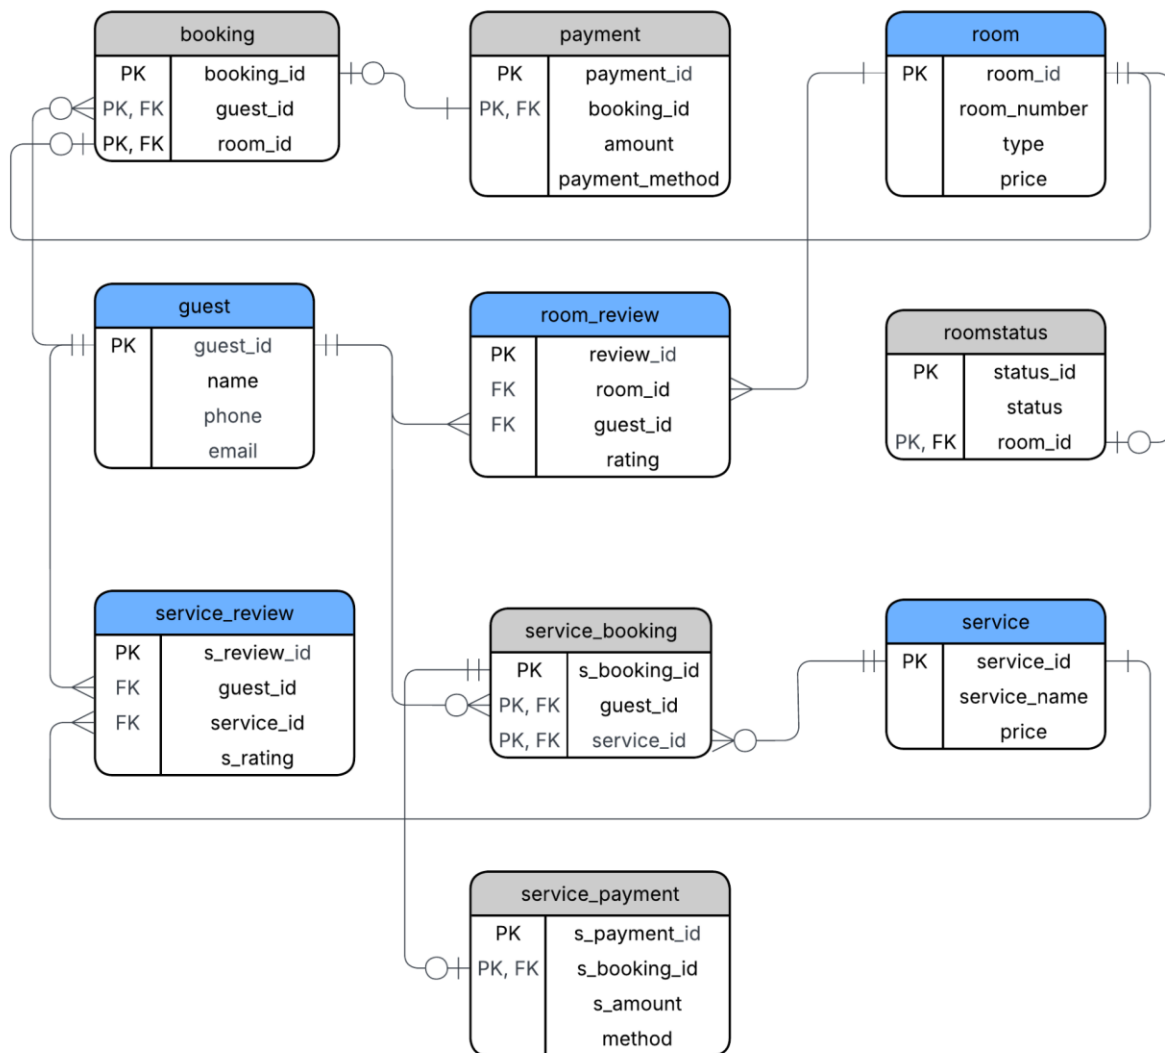

Project Name: Hotel Management System

INTRODUCTION

Topic: The project is about hotel management systems. It manages all the guest,rooms and services data within a hotel and makes management more efficient.

Purpose: The management system is mainly used by the guests in a hotel. With its help a guest can easily book rooms,check the availability of rooms, and book their desired rooms. Other than that, the guests can also easily book hotel services and check the reviews of rooms and services of the hotel as well. It makes guest hospitality much easier.

DATABASE DESIGN

IMPLEMENTATION OF REQUIREMENTS

Crud Features:

1. The registration page allows user to insert data into the guest table
2. The Room booking page allows user to read data from room table also update and insert data into the booking table and payment table.

3. The check your room booking page allows users to read data from booking table which joins with room table to show the type of rooms booked.
4. The exclusive service page allows user to read data from the service table/
5. The book a service page allows user to insert data into the service booking table and service payment table.
6. The check your service page allows users to read data from the service booking table which joins with service table to show the type of services booked.
7. The cancel your service page allows users to delete data from the service booking table and inserts data into the service review table
8. The room check out page allows users to delete data from booking table and insert data into room review table.
9. The room reviews page allows user to read data from the room review table.
10. The service review page allows users to read data from the service review table.

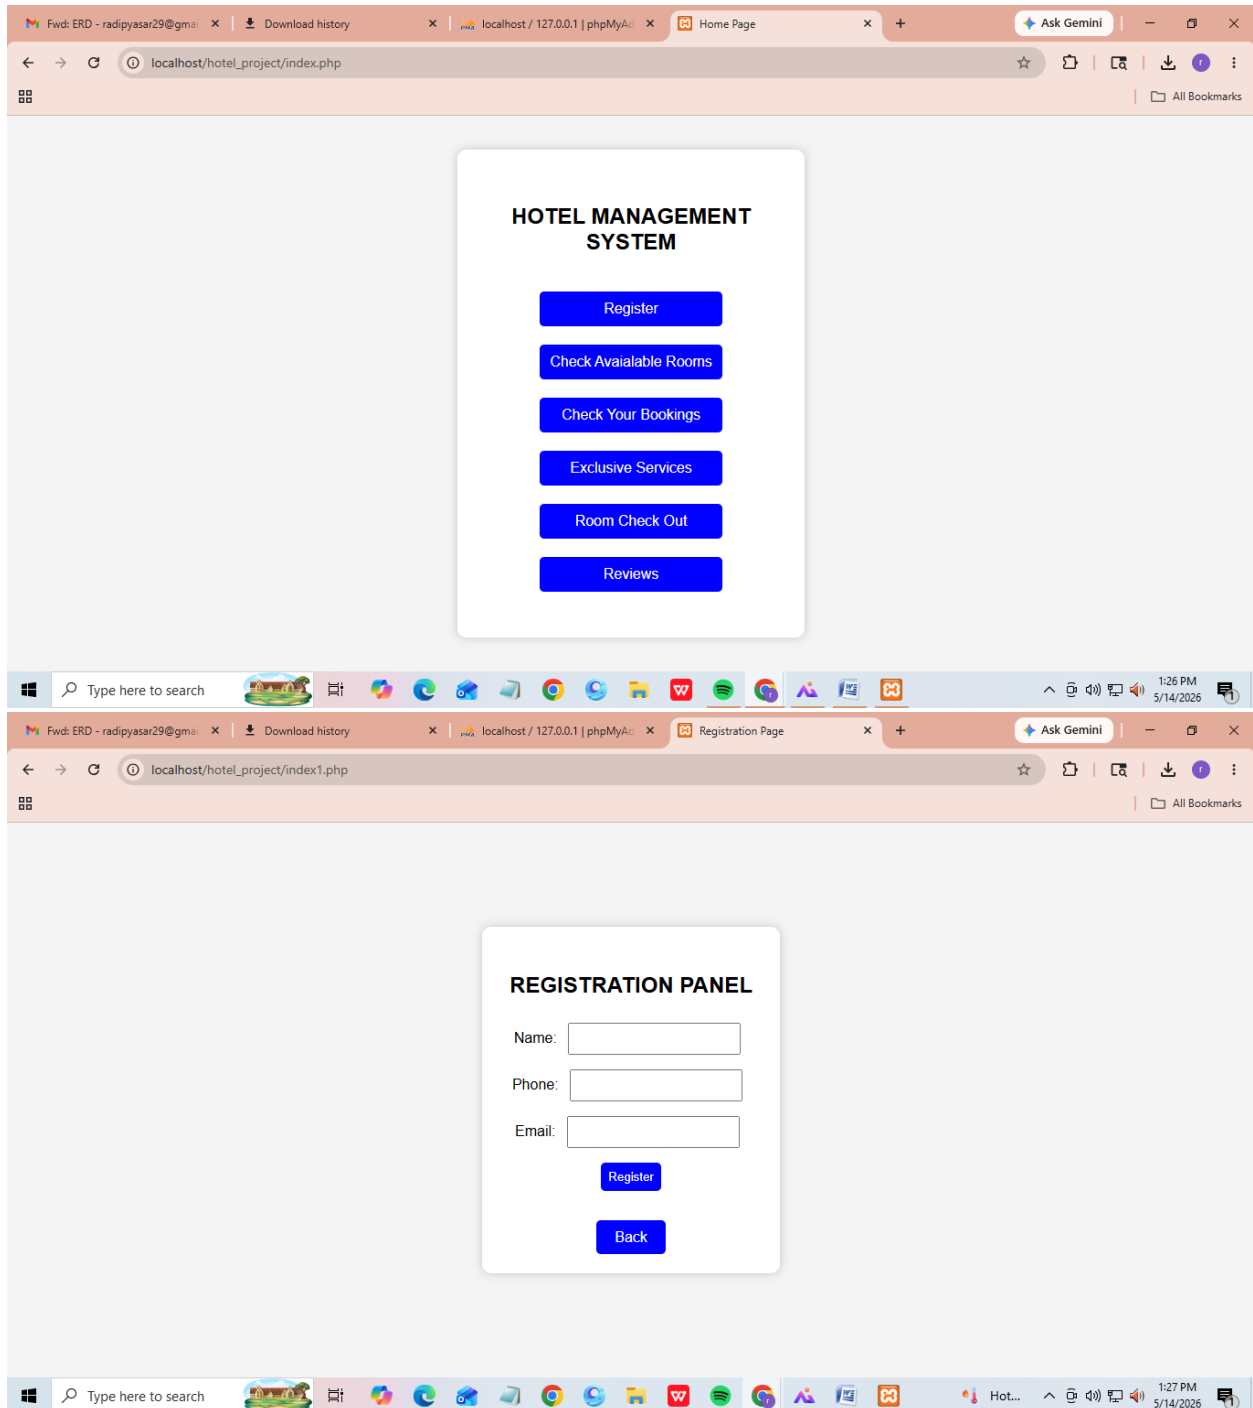

Authentication:

The registration system works by taking user inputs first and the inputs are mainly the user name, user phone number and user email. Then the system extracts those data and passes it to my index1.php file where in my php block an sql query runs to insert those data into the guest table of my hotel project database.

Search Feature:

The user after registering can search for various types of rooms available in the hotel and book one as well and later if the user wants the user can cancel it too but there will be no refund. Also the user can search for a few exclusive services and book one as well and same the user can cancel too.

CONCLUSION

The best feature of this project is the room booking and service booking part. There are various types of rooms and services available in this hotel and the user can book one of his choice and the system updates the user's booking and payment. A user cannot book a room twice and if a user books a room then that room is marked unavailable by the system so other users cannot see it in the available room page. Also a user can book a service only like if he has booked Spa service then he cannot book it again because he has already booked it.
